Interpolation L-chain of kappar-type, Bubgroup 3 Bence-Jones protein

Ti). IV. The complete amino acid sequence and its significance for the mechanism of antibody production.";

Hoppe-Seyler's Z., Physiol. Chem. 353:189-208(1972).

INTSCELLANEOUS: THE C REGION OF THIS CHAIN HAS THE INV (3) MARKER.

INTSCELLANEOUS: THIS is a Bence-Jones protein.

A The basic sequences of immunoglobulin kappa chains: sequence studies for the basic sequence of immunoglobulin kappa chains: sequence studies are of Bance Onnes protein.

B Let L. 2:301-304(1969) .

C -! - MISCELLANEOUS: This is a Bence-Jones protein.

This sequence represents the light chain variable region of the monoclonal antibody (RMD), KRIXI. This MAD produced by the cell line of the invention, specifically recognises the wild type factor VIII light chain. KRIXI can be used to inhibit the binding of factor VIII light willebrand factor in a dose dependant manner. The new cell line KRIXI, is deposited with the Belgian Coordinated Collections of Micro-organisms, under accession number LMBP 5089CB. KRIXI, or fragments of it, optionally with a thrombolytic agent, are useful for the treatment and/or prevention of hemostasis, coagulation disorder or thrombosic pathologic condition such as intravascular coagulation, arterial thrombosis, arterial restenosis, venous thrombosis or arteriosclerosis, and attenuation of coagulation in a mammal. An effective and safe antithrombotic therapy is provided which reduces the risk of bleeding in mammals, more particularly
                                                                                                                                                                                                                                                                                      120

                                                                                                                                                                                                                                                  The present invention relates to a pharmaceutical composition for the prevention and/or treatment of systemic inflammatory response syndrome (SIRS), sepsis, septic shock, thrombus formation in the microvasculature and disseminated intravascular coagulation in mammals, comprising as an active ingredient a partial inhibitor of factor VIII, in admixture with a carrier. Such inhibitors may include the antibodies B02CII and KRIXI. The present sequence is the light chain variable region of KRIXI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 anti-CD40 monoclonal antibody; CD40; cytostatic; virucide; antibacterial; immunostimulant; anti-HIV; hyperproliferative; cancer; viral; bacterial infection; immunodeficiency; neutropenia; HIV; gene therapy; human; light chain; 24-2-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                     The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody the invention demonstrates cytostatic, virunide, antibacterial, immunostimulant and anti-HIV such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody full length light chain protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                              ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              118

The present sequence represents a kappa chain of an antibody of the invention. The antibody is directed cytotoxic T-lymphocyte antigen (CTLA) -4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FR1-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to thinbib trans-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to used to up-regulate immune system to up-regulate immune system to up-regulate immune system to up-regulate immunodeficient
                                                                                                                                                                                                                                                                                                                                                                                                                                              ä

Ή.
         The present sequence represents a kappa chain of an antibody of the invention. The antibody is directed cytotoxic T-lymphocyte antiplen (CTLA) antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity discrete autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to used to up-regulate immune system to up-regulate immune disease.
                                                                                                                                                                                                                                                                                                                                                                 119

The invention relates to the use of human anti-cytotoxic T lymphocyte antigen-4 (anti-CTLA.4) antibody in the preparation of a medicament for the treatment of cancer such as bone cancer, pancreatic cancer, skin cancer, cutaneous or intraocular malignant melanoma, uterine and ovarian cancer, cancer of the anal region, stomach cancer, breast cancer, cesticular cancer and carcinoma of the fallopian tubes. The present sequence is human anti-CTLA-4 antibody kappa chain
                                                                                                                                                                                                                                                 9

monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (AILIM). (1) is useful for modulating signal transduction into a cell mediated by AILIM, for modulating proliferation of AILIM-expressing cells, for modulating production of a cyrokine from AILIM-expressing cells, for inducing antibody-dependent cytotoxicity against AILIM-expressing cells and/or immune cytolysis or apoptosis of AILIM-expressing cells, and/or immune cytolysis or apoptosis of AILIM-expressing cells. (1) is useful for treating, preventing or ransduction, and for inhibiting the onset and/or advancement of the prophylaxis of delayed type allergy. (1) is useful for treating and prevention and/or treatment of the contact-type dermatitis, autoimmune thyroiditis, allergic contact-type dermatitis, chronic inflammatory dermatosis, systemic lupus erythematosus, insulin-dependent diabetes mellitus, pooriasis, autoimmune or allergic disorders, inflammatory dermatosis, pooriasis, autoimmune or allergic disorders, inflammatory disorders of the the invention intestinal disorders such as ulcerative colitis, pneumonia, hepatitis, nephritis, vasculitis, and pancreatitis. (1) induces no serious antigenicity (HAMA) in a host. AAU74296-AAU74301 represent anti-mouse antigenicity (HAMA) in a host. AAU74296-AAU74301 represent anti-munen

                                                                                                                                                                                                                                            The invention relates to antibodies that interact with osteoprotegerin ligands (OPGL). The antibody is useful for detecting the level of OPGL in a blological sample. The antibody, or the pharmaceutical composition comprising the antibody, is also useful for treating osteopenic disorder, an inflammatory condition with attendant bone loss, an autoimmune condition with attendant bone loss in a patient or rheumatoid arthritis in a patient. In particular, the antibody or composition is useful for treating bone diseases, e.g. osteoporosis, bone loss from arthritis, baget's disease, osteopenia, endocrine osteoporosis (e.g. Cushing's syndrome or acromegaly), osteogenesis imperfecta, homocystinutia, Menkes' syndrome, osteomylelitis, hypercalcemia, or osteomerex an anti-OPGL-1 antibody

The present invention relates to a pharmaceutical composition for the prevention and/or treatment of systemic inflammatory response syndrome (SIRS), sepsis, septic shock, thrombus formation in the microvasculature and disseminated intravascular coagulation in mammals, comprising as an active ingredient a partial inhibitor of factor VIII, in admixture with a carrier. Such inhibitors may include the antibodies BO2CII and KRIXI. The present sequence is the light chain variable region of BO2CII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PGQAPRLLIYGASSRATDIPHRFSGSGSGTDFTLTISRLEPEDFAVYYCQQYGTSALLTF 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the light chain variable region of the human monotonal antibody (MAb), BO2C11. BO2C11 is a human MAb which recognises a conformational epitope within the carboxy-terminal of the factor VIII light chain. BO2C11 recognises both the wild type and Arg2150His factor VIII light chains. The MAb produced by the cell line of the invention, KRIXI, specifically recognises the wild type factor VIII light chain. KRIXI, as pecifically recognises the wild type factor VIII light chain. KRIXI, is deposited with the Belgian Coordinated Collections of Micro-organisms, under accession number LMBP 5089CB. KRIXI, or fragments of it, optionally with the helpian Coordinated Collections of Micro-organisms, under accession number LMBP 5089CB. KRIXI, or fragments of it, optionally with a thrombolylic agent, are useful for the treament and/or prevention of hemostasis, coaqulation arterial thrombosis, arterial restenois, venous thrombosis or arterisalelersis, and attenuation of coaqulation in a mammal. An effective and safe antithrombotic therapy is provided which reduces the risk of bleeding in mammals, more particularly in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PGQAPRLLIYGASSRATDIPHRFSGSGSGTDFTLTISRLEPEDFAVYYCQQYGTSALLTF 120

The antibody is directed cytocoxic T-lymphocyte antipled.

4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-liferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    117
                                                                                                                                                                                                                                                                                                           Novel antibodies capable of binding cytotoxic T-lymphocyte antigen (CTLA) -4 containing specified heavy and light chain sequences, useful for treating, e.g. immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

The present sequence represents a kappa chain of an antibody of the invention. The antibody is directed cytotoxic T-lymphocyte antigen (CTLA) + Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in 10R1, ODR2 and/Or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 PGQAPRILLIYGASSRATDIPHRFSGSGSGTDFTLTISRLEPEDFAVYYCQQYGTSALLTF 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PGQAPRLLIYGASSRATDIPHRFSGSGSGTDFTLTISRLEPEDFAVYYCQQYGTSALLTF 120
                                                                                                                                                                                                                                                                                                                      The invention relates to the use of human anti-cytotoxic T lymphocyte antigen-4 (anti-CTLA-4) antibody in the preparation of a medicament for the treatment of cancer such as bone cancer, pancreatic cancer, skin cancer, cutaneous or intraocular malignant melanoma, uterine and ovarian cancer, cancer of the anal region, stomach cancer, breast cancer, testicular cancer, uterine cancer and carcinoma of the fallopian tubes. The present sequence is human anti-CTLA-4 antibody kappa chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28

The invention relates to a novel human antibody (I), preferably a human monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (AILIM). (I) is useful for modulating signal transduction into a cell mediated by AILIM, for modulating proliferation of AILIM-expressing cells, for modulating production of a cytokine from AILIM-expressing cells, for inducing antibody-dependent cytocoxicity against AILIM-expressing cells, (I) is useful for treating, preventing or AILIM-expressing cells. (I) is useful for treating, preventing or prevention, and fessess associated with AILIM-mediated costimulatory transduction, and for inhibiting the onset and/or advancement of the diseases. (I) is useful for suppression, prevention and/or treatment of rheumatoid arthritis, multiple sclerosis, autolimmune thyroiditis, chronic inflammatory dermatosis, allergic discorders, inflammatory dermatosis, allergic discorders, inflammatory agaft versus psortacist, autolimmune or allergic discorders, immune rejection, disorders caused by abnormal intestinal immunity, specifically inflammatory incomining the profit of the structure or allergic discorders, immune rejection, disorders caused by abnormal intestinal immunity, specifically inflammatory incomining the preference of the service o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 PGQAPRLLIYGASSRATDIPHRFSGSGSGTDFTLTISRLEPEDFAVYYCQQYGTSALLTF 120

This sequence represents the human HII monoclonal antibody variable (V) region heavy (H) chain which specifically recognises the C-antigan. Such an antigen binding fragment may be used for treating a patient with neoplasia. It is especially useful in the detection of lymphomas and leukaemias where the tumour cells bearing the C antigen are circulating in the patients bloodstream. The polymucleotide sequence may be used as a primer or a probe and the encoded protein may be used in a vaccine or for gene therapy. The human monoclonal antibody (MAb), designated HII, specifically recognises cancerous cells. HII is specific for glioblastoma, neuroblastoma, malignant melanoma, breast adenocarcinoma, lung adenocarcinoma, malignant melanoma, colon adenocarcinoma and prostate adenocarcinoma.
